

Better cities ***for today and tomorrow***

The global mandate is clearer than ever. Thriving cities of tomorrow must be liveable, sustainable, and inclusive.

The time to act is now: Our changing world requires dynamic strategies that prepare cities to face future challenges while continuing to meet the needs of today.

Singapore's Centre for Liveable Cities (CLC) serves as a global knowledge centre for urban transformation by leveraging three key areas of expertise drawn from Singapore's own development journey and other global cities:

- Long term integrated planning and dynamic urban governance
- Future-oriented research supporting urban plans and policy
- Practitioner-led capability development

By building upon and sharing this collective knowledge, CLC contributes to developing highly liveable and sustainable cities that are resilient, inclusive, and future-ready, with a high quality of life.

Anticipating future urban challenges

We identify emerging drivers of change in economic, social and environmental areas to build preparedness and resilience in our urban systems.

Being at the nexus of public and private sectors, and academia, CLC engages city leaders, government agencies, industry leaders, institutes of higher learning, and communities. This enables us to continually build on our knowledge base, source for new ideas, and keep our research future-oriented. Through a science-based approach, CLC anticipates cross-sectoral urban challenges and supports the development of better strategies for liveability, sustainability, resilience, and regeneration.

Creating opportunities for connection, collaboration, and knowledge exchange

We curate opportunities for thought-provoking conversations, and convene international and local platforms for networking and cooperation.

Through the biennial World Cities Summit, Mayors Forums, Knowledge Councils, CLC lecture series, and publications, we gather the world's foremost thought leaders to identify and share innovative urban solutions, forging new partnerships across multiple sectors. We inspire city leaders, practitioners, and allied professionals to communicate perspectives and deepen conversations around urban development.

Developing future-ready capabilities

We conduct focused capability development programmes, facilitating the exchange of knowledge and perspectives between cities.

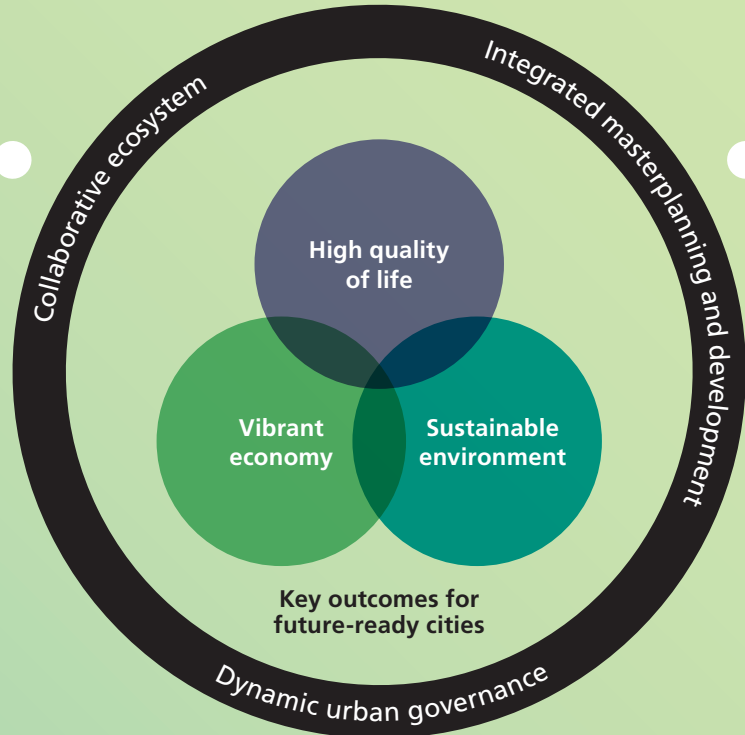

As the designated training centre in Singapore for the Infrastructure and Environment Sector, CLC's programmes are curated to meet the needs of local and international city leaders. As Cities are constantly changing, it is crucial that we develop forward-looking competencies, that can spawn innovative solutions suited for our respective contexts. CLC's programmes offer practitioner-based knowledge exchange, and collaborative learning.

Collaborative ecosystem

A collaborative ecosystem is where a city harnesses meaningful public-private-people partnerships that sustain shared values, deepen social trust and increase social resilience.

Transforming cities with future-focused capabilities and systems

Integrated masterplanning and development

Long-term planning (coordinated across multiple sectors) while allowing for the capacity to respond to fast-changing circumstances and deal with uncertainty, supporting overall resilience.

Dynamic urban governance

Principles and practices that institutions and governments should adopt to optimise the organisation of interaction, cooperation, and decision-making.
